Molecular Biotechnology Break-through

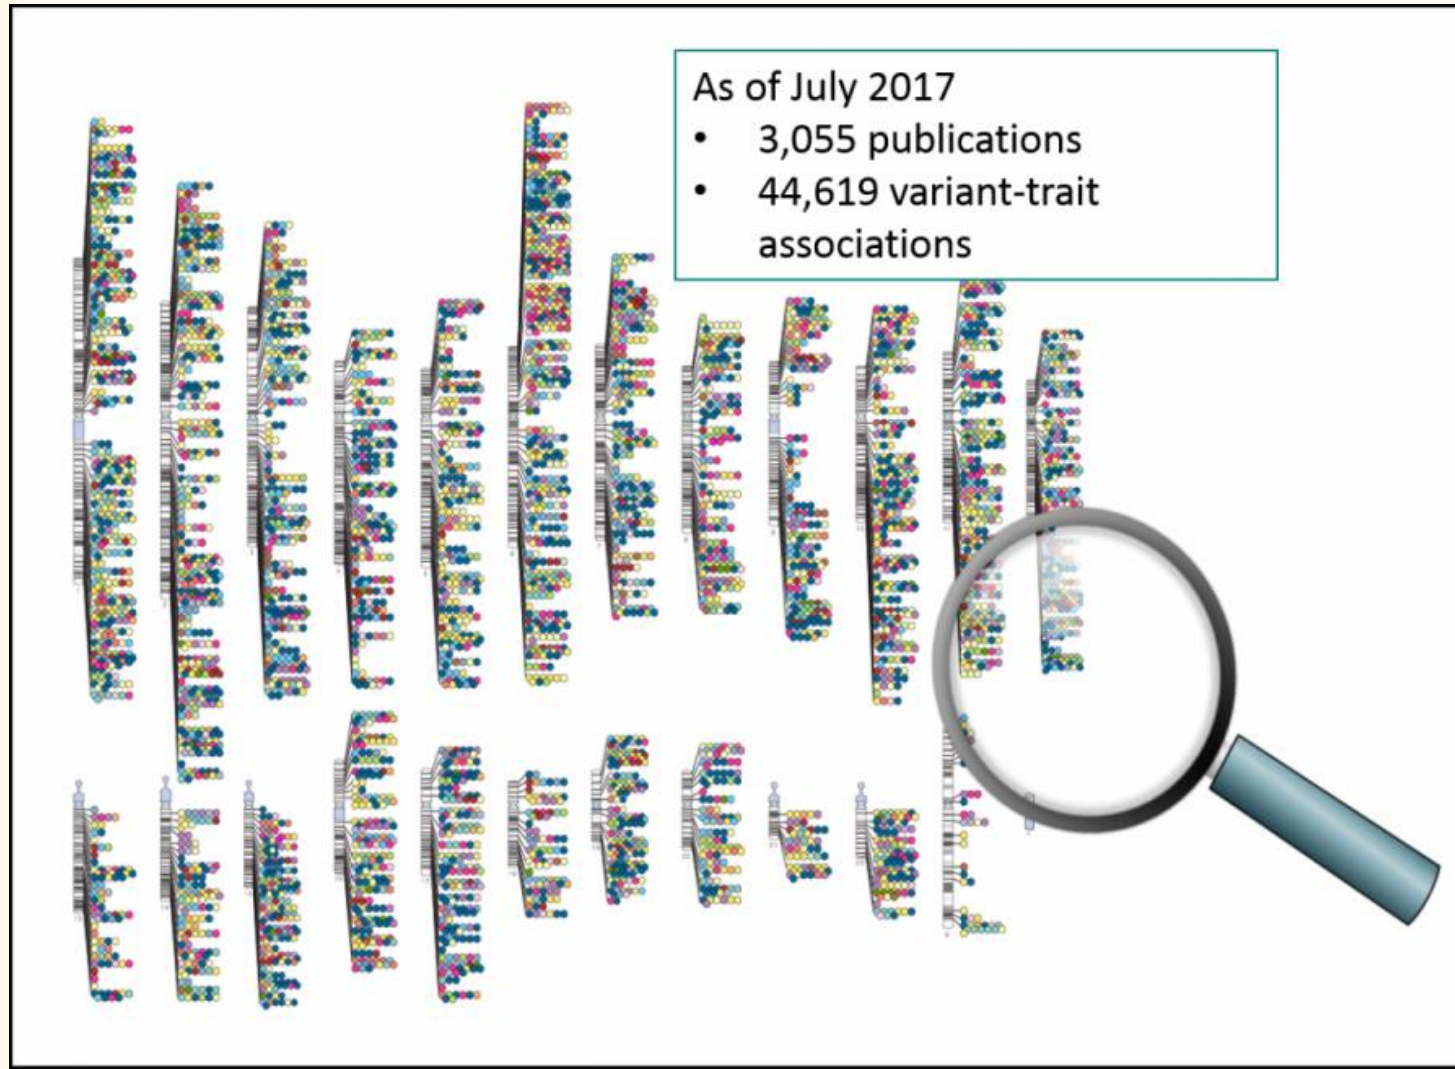

Completion of the Human Genome Project (2003) and publication of the HapMap Project results (2005) initiated the development of a wide range of technologies and applications including genomics, (NGS, nanopore, single molecule), transcriptomics (microarrays, molecular signature assays), proteomics (Mass spec), metabolomics (GC-MS, NMR), eDNA profiling, genetic breeding, precision medicine, personal genomics etc.

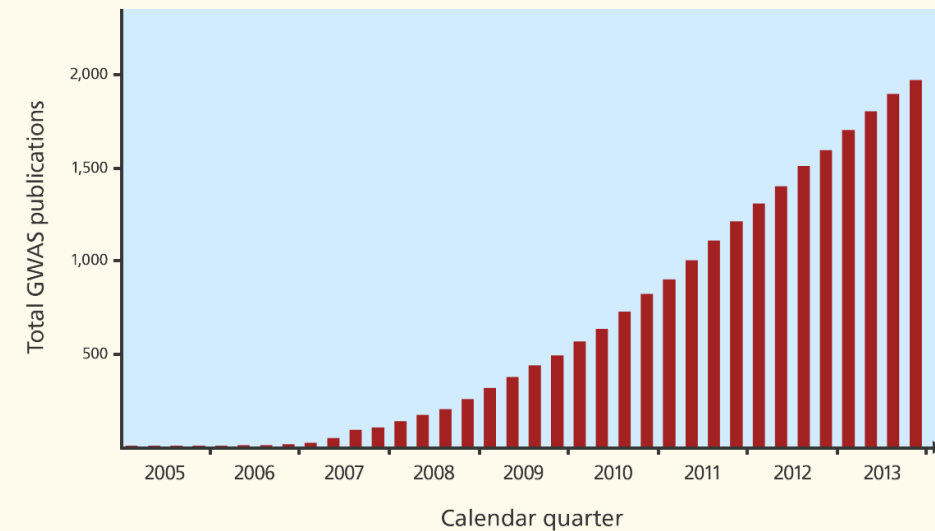

Obama, announcing his “Precision Medicine Initiative” Jan 30, 2015:

One study found that every dollar we spent to map the human genome has already returned \$140 to our economy

GWAS & SNP maps

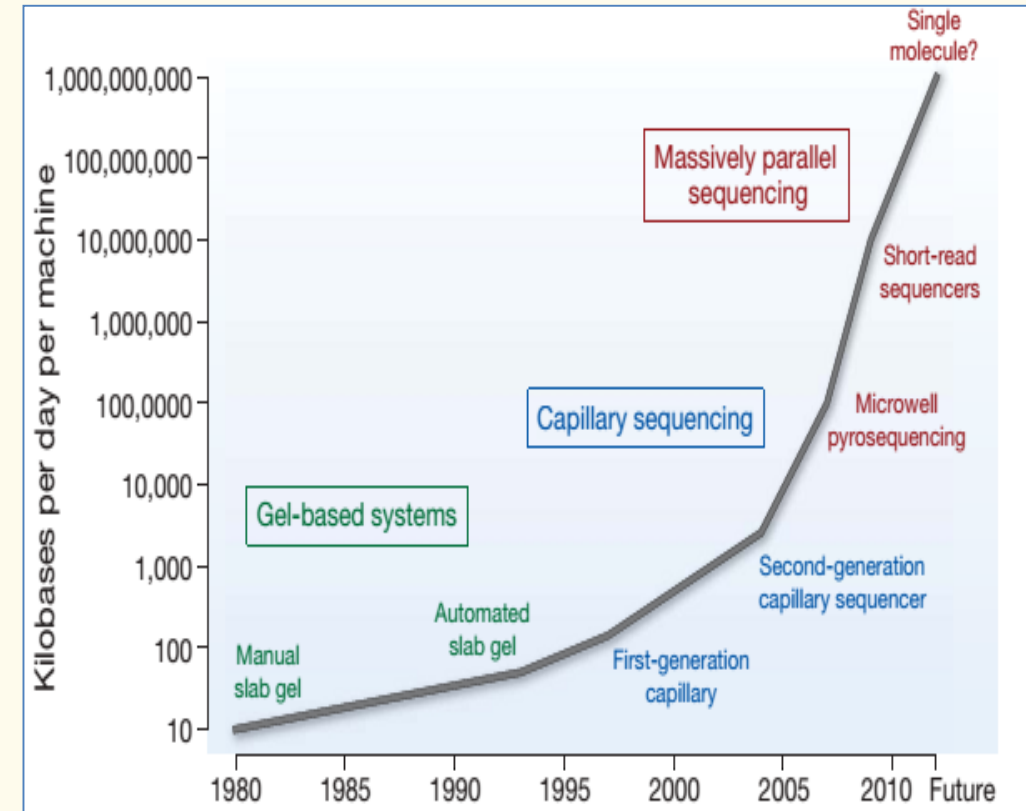

Number of GWAS since HapMap Project

DNA sequencing revolution

Low cost, huge output, broadly accessible and versatile

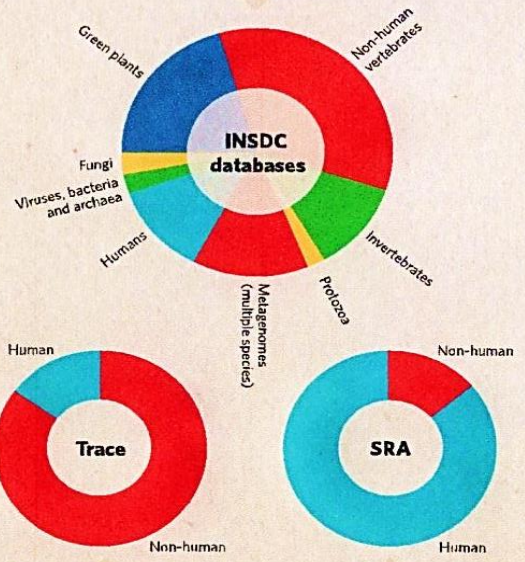

THE SEQUENCE EXPLOSION

At the time of the announcement of the first drafts of the human genome in 2000, there were 8 billion base pairs of sequence in the three main databases for 'finished' sequence: GenBank, run by the US National Center for Biotechnology Information; the DNA Databank of Japan; and the European Molecular Biology Laboratory (EMBL) Nucleotide Sequence Database. The databases share their data regularly as part of the International Nucleotide Sequence Database Collaboration (INSDC). In the subsequent first post-genome decade, they have added another 270 billion bases to the collection of finished sequence, doubling the size of the database roughly every 18 months. But this number is dwarfed by the amount of raw sequence that has been created and stored by researchers around the world in the Trace archive and Sequence Read Archive (SRA). See Editorial, page 649, and human genome special at www.nature.com/humangenome

DNA SEQUENCES BY TAXONOMY

International Nucleotide Sequence Database Collaboration: The main repositories of 'finished' sequence span a wide range of organisms, representing the many priorities of scientists worldwide.

Trace Archive: Developed to house the raw output of high-throughput sequencers built in the late 1990s, the trace archive spans a wide range of taxa.

Sequence Read Archive: Houses raw data from next-generation sequencers. Dominated by human sequence, including multiple coverage for more than 170 people.

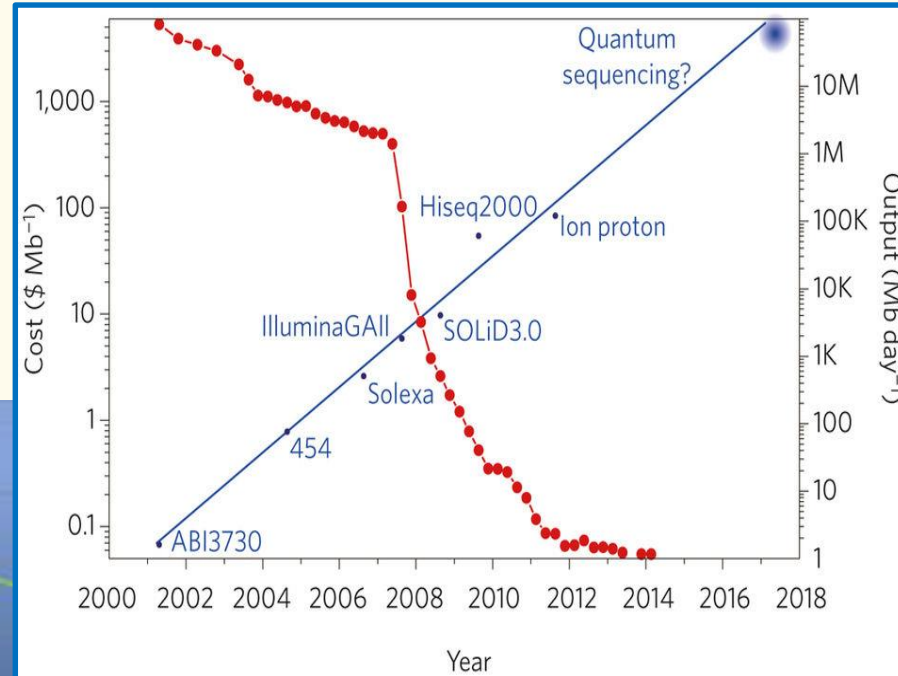

HOW MANY HUMAN GENOMES?

The graphic shows all published, fully sequenced human genomes since 2000, including nine from the first quarter of 2010. Some are resequencing efforts on the same person and the list does not include unpublished completed genomes.

Chromosomal SNPs in Ancestry Panel

mtDNA & Chr-Y DNA

as species and ancestry identification markers

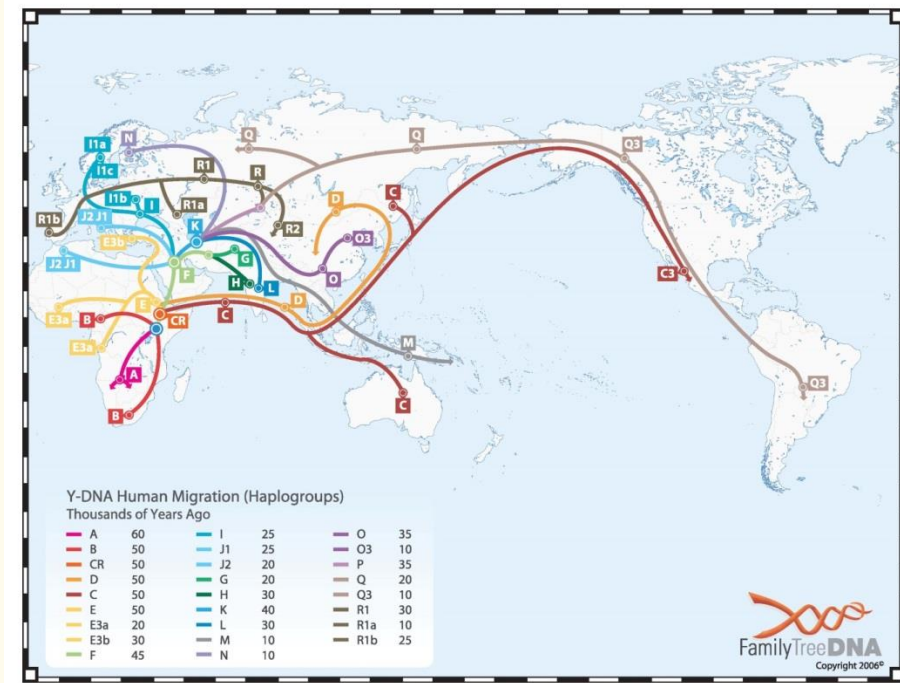

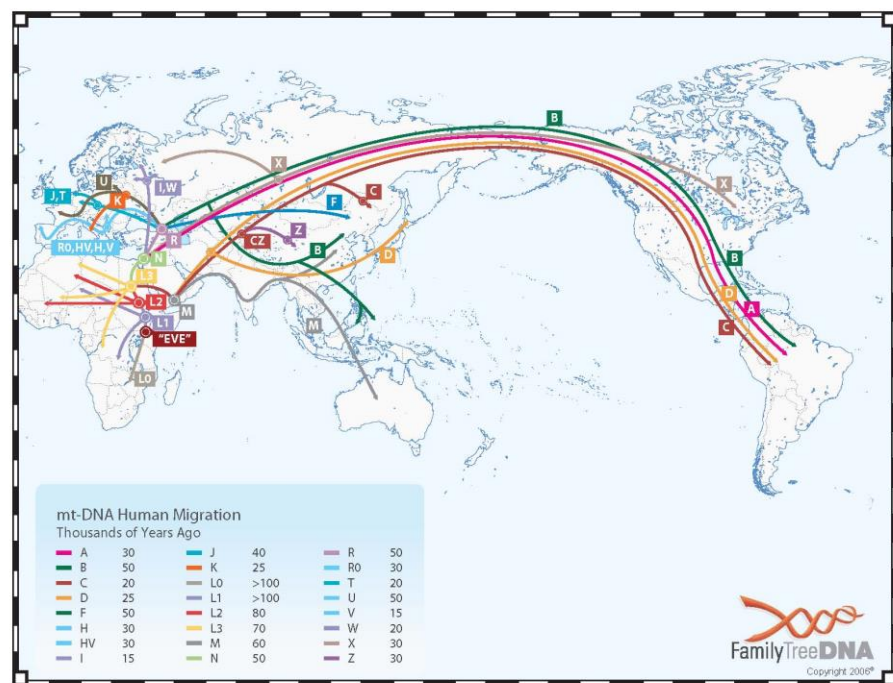

mtDNA in most species is maternally inherited, matching individuals with “recent” ancestry in haplogroups different in various populations.

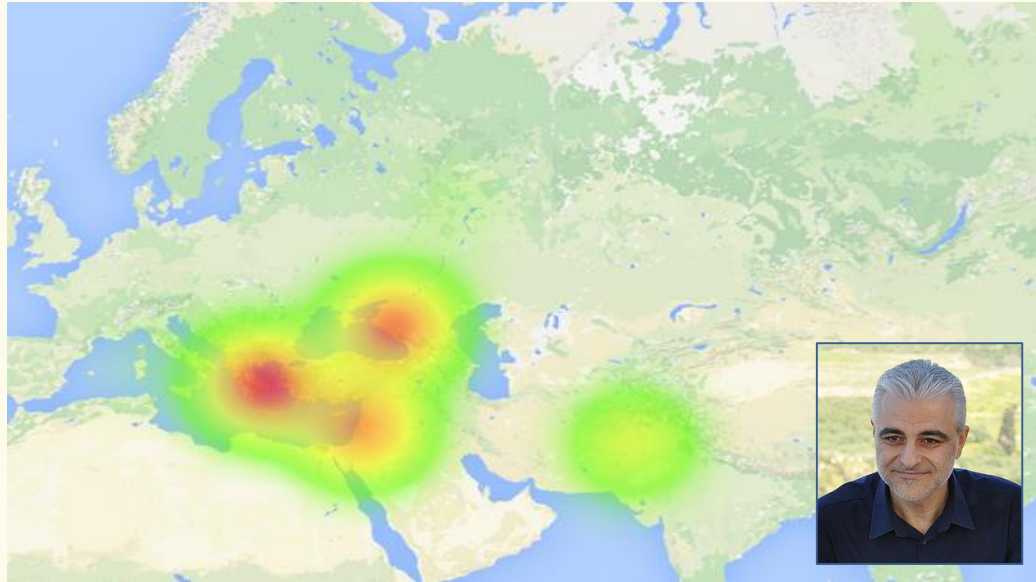

Chr-Y is a marker of patrilineal ancestry with Short Tandem Repeats (STRs) and Single Nucleotide Polymorphisms (SNPs) markers defining also haplogroups.

Deduced human migration map based on mtDNA & Chr -Y

Ancestry tests

| Population Name | Geographic Location | Sample Size | Likelihood |

Ancient DNA Damages

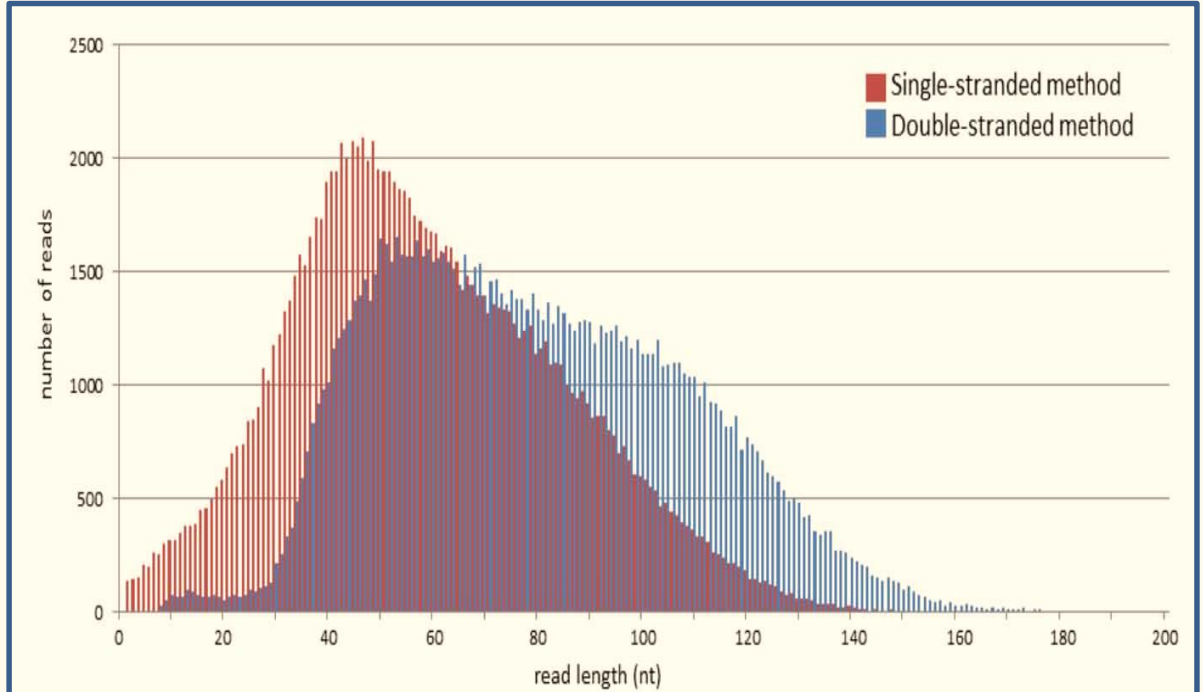

Figure 2. Typical size distributions of raw reads from single-stranded and double-stranded libraries. Overlapping histograms of the distribution of insert sizes for Ion Torrent libraries prepared from sample Mam2 with either single-stranded (red) or double-stranded (blue) libraries show typical characteristics of insert size incorporation observed for each method. Adapter sequence has been trimmed by the Ion Torrent Software Suite, which also removes inserts 4 bp or less for the double-stranded library. The 34 bp sequences flanking the insert for the single-strand procedure (see Supplementary Material) and PCR duplicates for both libraries have been removed. The total number of reads has been normalized between the two libraries.

People

Research Plans

- Studies for elucidating origins, migrations, environment and relations of ancient populations: Focus on the Corinthian Colonization

(proposal submitted)

- Genetic characterization, Digitization & Reconstruction of ancient individuals

(proposal in preparation)

- Exploration & modelling of genetic markers as a means for spatiotemporal classification of human archeological remains

Perspectives

- Establish a state-of-the-art Archeogenetics facility within the framework of the National and European Research Infrastructures of Cultural Heritage
- Develop advanced analytical methods, handling protocols and interpretation services, addressing the needs of the Archeological community and unravelling the huge wealth of Greece in archeological findings
- Promote multidisciplinary approaches in Archeogenetics, Bioarcheology and Paleontology research, expand towards Archeoproteomics and provide access to an advanced, competence center facility
- Bridge the gap between humanities and biotechnologies and work towards the integration of highly heterogeneous and distributed Archeological research data
